Applicant's election of Group I, claims 1-27, 42, and 43 in the reply filed on September 18, 2007 is acknowledged. Because applicant did not distinctly and specifically point out the supposed errors in the restriction requirement, the election has been treated as an election without traverse (MPEP § 818.03(a)).

It is noted that with the amendment of September 18, 2007, amended claim 28 will be added to Group I and examined in this action.

It is again noted that claims 29-39 are directed to a "use" wherein a "use" is nonstatutory subject matter. If necessary, claims 29-39 may be added to the election/restriction requirement.

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-28, 42, and 43 are rejected under 35 U.S.C. 103(a) as being unpatentable over Bjurenvall (US 7,005,155) in view of Burrows et al (US 4435429).

Bjurenvall disclose a process for manufacturing a cereal product wherein bran is fractionated into glucose, protein, and fiber (see Figure 2). Bjurenvall disclose a process where the bran obtained from milling is subjected to enzyme hydrolysis using amylase and amyloglucosidase at a pH of 4.5 to 5.2 and a temperature of 50 to 75°C,

whereby glucose syrup, protein, and bran are obtained as end products (see entire patent, especially column 2, line 53 to column 4, line 5).

The claims differ as to the specific recitation of centrifugation.

Burrows et al disclose a cereal grain fractionation where centrifugation is used to separate fractions (see entire patent, especially column 4, lines 3-10).

It would have been obvious to a person of ordinary skill in the art, at the time the invention was made, to use centrifugation as taught by Burrows et al in that of Bjurenvall because the use of centrifugation to separate fractions is conventional and well-known in the cereal grain art. Applicant is using known components and process steps to obtain no more than expected results.

With respect to Applicant's limitations as to percent protein, sugar, oil, and fiber within the fractions it is not seen that this would differ from that of the prior art as the same components and steps are used. It is further noted that the use and manipulation of enzymes to hydrolyze cereals is conventional in the art. The amounts employed are no more than a matter of choice.

Goering et al (US 5013561) is cited as of interest to the claimed invention.
